COVID-19 Provincial Testing Guidance Update

April 8, 2020

As the COVID-19 outbreak continues to evolve and laboratory testing capacity has increased, Ontario's provincial testing guidance is also being updated.

It is expected that this guidance will be consistently applied across all regions in Ontario.

This guidance adds to the initial COVID-19 Public Health Guidance on Testing and Clearance. This information is current as of April 8, 2020.

Additional guidance is expected to be provided in the coming days to increase the testing of Ontarians. This will initially focus on vulnerable populations and congregate settings, and then include broader population groups to better understand disease spread in Ontario.

There are four updates to the guidance provided in this document:

1. **Hospital inpatients and residents living in long-term care homes and retirement homes**
2. **Health care workers/caregivers/care providers in those settings**
3. **Remote/Isolated/Rural/Indigenous communities**
4. **Priorities in situations of resource shortages**

1. Hospital Inpatients and Residents Living in Long-Term Care and Retirement Homes

Definition: Patients requiring/likely requiring inpatient admission. This does not include outpatients.

OR

Residents living in either long-term care/nursing homes or retirement homes where:

- **Long-term care/nursing homes:** Health care homes designed for adults who need access to on-site 24-hour nursing care and frequent assistance with activities of daily living
- **Retirement homes:** Privately-owned, self-funded residences that provide rental accommodation with care and services for seniors who can live independently with minimal to moderate support

Testing Guidance:

Following active surveillance, any patient/resident with the following, should be tested:

Symptomatic patients/residents in line with the provincial case definition, who are experiencing one of the following symptoms revised from previous guidance:

- Fever (Temperature of 37.8°C or greater); OR
- Any new/worsening acute respiratory illness symptom (e.g. cough, shortness of breath (dyspnea), sore throat, runny nose or sneezing, nasal congestion, hoarse voice, difficulty swallowing, new olfactory or taste disorder(s), nausea/vomiting, diarrhea, abdominal pain); OR
- Clinical or radiological evidence of pneumonia.

Atypical presentations of COVID-19 should be considered, particularly in elderly persons. For a list of potential atypical symptoms, please see Appendix.

Asymptomatic patients: Asymptomatic patients transferred from a hospital to a long-term care home or retirement home should be tested prior to transfer. A negative result does not rule out the potential for incubating illness and all patients should remain under a 14-day self-isolation period following transfer.

In the event of a symptomatic resident in a long-term care home or retirement home, asymptomatic residents living in the same room should be tested immediately along with the symptomatic resident.

In the event of an outbreak of COVID-19 in a long-term care home or retirement home asymptomatic contacts of a confirmed case, determined in consultation with the local public health authority, should be tested including:

- All residents living in adjacent rooms
- All staff working on the unit/care hub
- All essential visitors that attended at the unit/care hub
- Any other contacts deemed appropriate for testing based on a risk assessment by local public health

Local public health may also, based on a risk assessment, determine whether any of the above-mentioned individuals do not require testing (e.g. a resident that has been in self-isolation during the period of communicability).

2. Healthcare Workers/Caregivers/Care Providers/First Responders

This section applies to healthcare workers, caregivers (i.e. volunteers, family members of residents in an institutional setting), care providers (e.g., employees, privately-hired support workers) and first responders.

Testing Guidance:

All healthcare workers, caregivers, care providers and first responders, should be tested as soon as is feasible, if they develop any symptom compatible with COVID-19, including atypical symptoms (see Appendix).

3. Remote/Isolated/Rural/Indigenous Communities

Testing Guidance:

Testing should be offered to individuals who are experiencing one of the following symptoms:

- Fever (Temperature of 37.8°C or greater); OR
- Any new/worsening acute respiratory illness symptom (e.g. cough, shortness of breath (dyspnea), sore throat, runny nose or sneezing, nasal congestion, hoarse voice, difficulty swallowing, new olfactory or taste disorder(s), nausea/vomiting, diarrhea, abdominal pain); OR
- Clinical or radiological evidence of pneumonia.

Atypical presentations of COVID-19 should be considered, particularly in elderly persons and children. For a list of potential atypical symptoms, please see Appendix.

In the event of a confirmed case of COVID-19 in a remote, isolated, rural or Indigenous community testing of asymptomatic contacts should be considered in consultation with the local public health authority.

4. Priorities in Situations of Resource Limitations

All facilities conducting testing should ensure an appropriate amount of swabs are available and exercise prudence when ordering swabs to ensure an equitable distribution across the province. Where there are shortages of testing supplies, the following groups should be **prioritized** for testing within 24 hours to inform public health and clinical management for these individuals:

- Symptomatic health care workers (regardless of care delivery setting) and staff who work in health care facilities
- Symptomatic residents and staff in Long Term Care facilities and retirement homes and other institutional settings e.g. shelters, mental health institutions, prisons, hospices and other congregate living settings (as per outbreak guidance)
- Hospitalized patients admitted with respiratory symptoms (new or exacerbated)
- Symptomatic members of remote, isolated, rural and/or indigenous communities
- Symptomatic travelers identified at a point of entry to Canada
- Symptomatic first responders (i.e. firefighters, police)
- Individuals referred for testing by local public health

Reminders:

- Testing of asymptomatic patients, residents or staff is generally not recommended.
- Clinicians should continue to use their discretion to make decisions on which individuals to test.

Appendix:

Atypical Symptoms/Signs of COVID-19 Seen in Older Adults

Symptoms

- Unexplained fatigue/malaise
- Delirium (acutely altered mental status and inattention)
- Falls
- Acute functional decline
- Exacerbation of chronic conditions
- Chills
- Headaches
- Croup

Signs

- Unexplained tachycardia
- Decrease in blood pressure
- Unexplained hypoxia (even if mild i.e. O₂ sat <90%)
- Lethargy, difficulty feeding in infants (if no other diagnosis)
